
Code Level B20 Catia LINK

when placing an object into a part on the assembly, you can drag-and-drop it into the top-level of the product. however, if a part has a coordination object and a sub-product below it, you can only place the part in the top-level of the sub-product, otherwise the command will be placed as a new product. when you are placing a part into the top-level of a product or sub-product, you may find that it is already placed into it. to find out where the part is placed, you can navigate to the assembly file and locate where the object is. within the assembly file, the file will have an attribute named "name". if you open the "display" pane and scroll to the right, you will see the "name" attribute. the object "name" may be rather similar to a product name on a command level within your tree. however, on a product level, the product name will consist of the name of the part plus a name/number of the product. for a part that has a parent that is a product, the name will look like "part-name" instead of "product-name". when you copy an object from a sub-product to the top-most level of a product, you will notice that the new location is almost the same as the location of the original object in the sub-product. in the example below, you can see that the move tool is highlighted yellow. this indicates that this particular object is a duplicate. you may then move the original object to be "deleted". you can choose to specify an x/y/z/rotate3d, when you "mover" an object, you can always specify an x,y,z, rotate or euler angle. if you do not specify any of these items, you will notice that an object will be moved to the first location in your tree. for example, if you have an object named "part a", you can have another object with the same name and a parent. if you place both objects on the assembly, you can then move this second object into the top-level of the parent object. any changes made to the parent object will now also affect the second object.

Code Level B20 Catia

if you have a part where the z=0 plane is located at the bottom of the assembly, you can rotate the part to locate the x/y plane. for example, if you have a part that has a z-plane that is at the bottom of the assembly, you can rotate the part. this will then create a new object with a z-plane that is at the top of the part. this will then allow you to move the part up in your tree to the location it was originally at the bottom. follow the instructions in the article to access the dassault systemes knowledge base. then follow the instructions to access the individual article. copy and paste the url for the individual article into a web browser. login and navigate to the article then download the link for the hot fix for b20r23. this download can be done in the same way as the service pack which should be previously downloaded. note: if the hot fix does not appear in the service packs list then it is not up-to-date with your version of catia so it will not be installed. you can access the current status of your catia software by clicking on the "version management" button in the toolbar of the catia software. take note that in this window the version number changes from version to version so if the version number of your catia software has not changed then the hot fix is up-to-date for that version. there are two ways to apply the hot fix. if you are sure you have already committed the service pack to your catia software then select "commit service pack". if you are unsure then select "check for update". the installation will continue and may take some time. once the installation has completed you will need to update your catia software and then follow the instructions in the article to locate the hot fix.
